

```
search_line_edit->setMinimumSize(50, 25);
QSplitter *search_splitter = new QSplitter(this);
search_splitter->setFrameShape(QFrame::NoFrame);
search splitter->setHandleWidth(1);
QHBoxLayout *forward_layout = new QHBoxLayout();
forward layout->addWidget(forward path);
forward_layout->addStretch();
forward layout->addWidget(forward button);
forward layout->setSpacing(0);
forward_layout->setContentsMargins(0, 0, 0, 0);
forward_line_edit->setLayout(forward_layout);
//防止文本框输入内容位于按钮之下
forward_line_edit=>setTextMargins(forward_path=>width(), 0, forward_button=>width(), 0);
QHBoxLayout *search_layout = new QHBoxLayout();
search_layout->addStretch();
search_layout->addWidget(search_button);
search layout->setSpacing(0);
search_layout->setContentsMargins(0, 0, 0, 0);
search_line_edit->setLayout(search_layout);
search_line_edit->setTextMargins(0, 0, search_button->width(), 0);
search splitter->addWidget(forward line edit);
search_splitter->addWidget(search_line_edit);
search_splitter->setStretchFactor(0, 8);
search_splitter->setStretchFactor(1, 2);
search splitter->setChildrenCollapsible(false);
forward_line_edit->setStyleSheet("QLineEdit{border-style:outset; border-top-width:1px; border-
left-width:1px; border-bottom-width:1px; border-top-color:gray; border-left-color:gray; border-
bottom-color:gray; background:white;}");
search_line_edit->setStyleSheet("QLineEdit{border-style:outset; border-top-width:1px; border-
right-width:1px; border-bottom-width:1px; border-top-color:gray; border-right-color:gray; border-
bottom-color:gray; background:white;}");
search_splitter=>setStyleSheet("QSplitter::handle{background:lightgray;}");
效果如下:
                                                               0
                                                    search
                          computer
OK, 关于输入框与按钮的事件就不再多说,实现槽函数,连接对应的信号和槽就行!
